Startup 6: Adding a Web Server

Continued to work on Startup 5 server functions. Jason, Brittany, and Nick implemented the right sidebar server functions for retrieving event information from the mock database. We are still having trouble rendering the pulled data in the right side bar, but our server function is pulling the event items correctly (checked with console.log() statements). This should be a quick fix. We have not yet implemented the server functions for the create event page. We are planning to have group meetings over the next few days to finish implementing the right sidebar buttons, create event sheet, and convert the calendar table widget to a functioning React object.

Most recent updates are in the branch called "real-server"
